PRE PRI ME

IMP REG NATI ON

Viron Indonesia is proud to present PrePrime Impregnation, another breakthrough to add to our long list of cutting-edge developments, merging their aesthetic appeal with Viron's storied innovations in environmentally-conscious coatings solutions.

WWW.VIRONCOATING.COM

PrePrime Impregnation is a water-based staining system that, unlike our competitors, seeps deep into wood panels, WPC, and fiber cement surfaces, ensuring darker shades which don't fade with age. It's also equipped with hardening agents (Cross-Linker) applied by manual spray to ensure surfaces don't warp or crumble post-application; concurrently, PrePrime Impregnation does not compromise on adhesion strength, and may also be combined with UV-roller coatings for **interior and exterior use**.

PrePrime Impregnation prepares surfaces for further coating by creating a tough and durable primary layer; Viron Indonesia recommends a hybrid system of coatings, combining PrePrime Impregnation with related products such as DemiDech and Ultra Clear.

Here at Viron, we believe that the status quo is never enough: day in and day out, our constant drive to pioneer new paint and coating systems ensures the products you receive are always at the cutting edge of innovation.
